

Propertypeak – Deployment Checklist (Printable)

Use this checklist every single time before touching production.

BEFORE WORK (Staging Preparation)

- ☐ Confirm you are working on **staging.propertypeak.in**
- ☐ Sync production data to staging

```
sync-prod-to-staging.sh
```

Purpose: - Staging reflects real data - Prevents false test results

DURING DEVELOPMENT

- ☐ Make **code changes only** (no real data edits)
- ☐ Check changes using Git

```
git status  
git diff
```

- ☐ Commit changes with a clear message

```
git commit -m "Describe change clearly"
```

TESTING ON STAGING

- ☐ Homepage loads correctly
- ☐ Property listing page works
- ☐ Property detail page works
- ☐ Images load properly
- ☐ Admin panel works
- ☐ Mobile view checked

If anything breaks → **fix on staging, not production**

BEFORE PRODUCTION DEPLOY

- ☐ Feature works fully on staging
- ☐ Tested using real data
- ☐ No last-minute changes pending

PRODUCTION DEPLOY

- Deploy **the exact same code** tested on staging
- Clear caches:

```
php artisan optimize:clear
```

POST-DEPLOY CHECK

- [] Homepage
- [] One property detail page

Stop after verification.

RULE TO REMEMBER

If it didn't survive staging, it doesn't go to production.
