

Propertypeak Deployment SOP

Standard Operating Procedure for Safe Staging & Production Deployments

Purpose

This SOP defines a safe, repeatable, and stress-free process to test features on staging.propertypeak.in and deploy them confidently to propertypeak.in without impacting real users.

1. Environment Roles

Staging: Used for testing, experimentation, and validation using real production-like data.

Production: Used only for stable, approved code. No experimentation allowed.

2. Tools & Responsibilities

Git: Tracks and controls code changes, history, and rollback.

Sync Script: Copies production database and media into staging for realistic testing.

3. Standard Deployment Procedure

1. Sync production data to staging using the sync script.
2. Make code changes and commit them using Git.
3. Deploy the code to staging and test thoroughly.
4. Approve the tested commit for production.
5. Deploy the same commit to production and clear cache.
6. Verify core pages and stop.

4. Emergency Rollback Procedure

If production shows unexpected behavior after deployment:

- Identify the last commit using Git.
- Revert the commit.
- Clear cache.
- Verify that the site is stable again.

Never debug directly on production.

Deployment Flowchart
