

Propertypeak – Emergency Rollback Plan (Printable)

This plan removes panic when something goes wrong.

WHEN TO USE THIS

- Site behaves unexpectedly after deployment
- Feature breaks on production
- Users report issues

Do not debug on production.

IMMEDIATE ACTION (STAY CALM)

1. Stop all changes
 2. Open terminal in production code directory
-

STEP 1: FIND LAST CHANGE

```
git log
```

- Identify the most recent commit
 - Copy the commit ID
-

STEP 2: REVERT THE CHANGE

```
git revert <commit-id>
```

This: - Reverses the bad change - Keeps Git history clean

STEP 3: CLEAR CACHE

```
php artisan optimize:clear
```

STEP 4: QUICK VERIFICATION

- [] Homepage loads
- [] One property page works

At this point, production is safe.

AFTER ROLLBACK (PROPER FIX)

- Go back to **staging**
 - Fix the issue
 - Test thoroughly
 - Deploy again only after confirmation
-

ABSOLUTE RULES

- Never panic-fix directly on production
 - Never bypass staging
 - Never skip cache clearing
-

REMEMBER

Rollback is not failure. It's professional damage control.
